Science 287:2185-2195(2000).

CC '- FUNCTION: Participates in DNA replication and may participate in
CC repair Exhibits a magnesium dependent ATP-dependent DNA-helicase
CC activity that unwinds single- and double-stranded DNA in a 3'-5'
CC direction (By similarity).

CC '- SUMSIEARIUAR LOCATION: Nuclear (By similarity).

CC '- SIMILARITY: BELONGS TO THE HELICASE FAMILY. RECQ SUBFAMILY.
                                                                                              CONFLICT
                                                                                                                                             CONFLICT

                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents the human WRN gene product which is associated with Werner's syndrome. The products can be used for the detection and treatment of Werner's syndrome (WS), an autosomal recessive disorder with a complex phenotype, as well as related diseases.
                                                                                                                                                                                                                                                                                                                                                                                         Sequence

The mouse WRN gene is useful for the diagnosis of human Werner's syndrome.

A claimed assay for identifying a compound which extends life span comprises administering a compound to be tested to a mammal with a suppressed level of mWRN, and identifying slowing of at least one of the normal phenotypes of ageing in the mammal. A compound identified by this method inhibits the replication and/or accumulation of rDNA circles in a cell. The assay can be performed using a mWRN knockout mouse (also claimed). mWRN nucleic acids can be used to produce mWRN polypeptides and as diagnostic probes and primers. mWRN polypeptides can be used to raise antibodies (for inhibiting activity of mWRN or for determining it in tissues). The assay is based on the observation that in yeast

A mutation in the yeast MRN homologue SGSI causes premature ageing, suggesting a common ageing mechanism in all eukaryotes. Insight into the ageing process in model systems can provide insight into

The corresponding human gene product (AAY14517) is associated with Werner's syndrome. The products can be used for the detection and treatment of Werner's syndrome (WS), an autosomal recessive disorder with a complex phenotype, as well as related diseases.
                 Drosophila melanogaster polypeptide SEQ ID NO 41517

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated nucleic a
genes from Drosophila
interactions -
             26-MAR-2002
                                        ABB62653;
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Disclosure; SEQ ID NO 41517; 21pp + Sequence Listing; English.
                                                                 ABB62653 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an isolated nucleic acid detection reagent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI; 2001-656860/75.

The chivention relates to a method for identifying DNA encoding proteins imparting environmental stress resistance. The method comprises inserting color imparting environmental stress resistance. The method comprises inserting color from a library originating in a salt-resistant organism into a host cell, culturing the transformants under conditions in which the cuntransformed host does not grow well, and selecting for viable clones. The method is useful for obtaining DNA encoding environmental stress resistance factors. The DNA encoding proteins conferring environmental stress resistance, can be used in the production of plants resistant to environmental stress, which can be cultivated in unfavourable environments such as deserts, salt damaged ground, cold regions and the coeans. They can be used for increasing the area of land covered by green plants, and desert greening and afforestation, in order to counter the effects of the increase in atmospheric carbon dioxide concentration. PCR primers AAF74219 and AAF74220 are used in an example illustrating the

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA05734 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host calls comprising a nucleotide of the invention, methods of producing the novel polypeptides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may have various activities; stem cell growth factor activity; haematopoiesis regulatory activity; tissue growth activity; haematopoiesis regulatory activity; tissue growth activities; or may be involved in oncogenesis, cancer cell proliferation or cell thrombolytic activities; receptor or ligand activities; or may be invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include cancers, heamatopoietic disorders (e.g., myeloid or lymphold cell disorders), chronic inflammatory conditions (e.g., asthma or arthritis), proliferative rethinpathy, atherosclerosis, coronary heart disease, arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal vascular growth. Polypeptides involved with tissue regeneration and repair (or nucleic acids encoding them) may be used to promote wound healing (e.g., of burns, incisions and ulcers), while those with bacterial and fungal infections in addition to immune disorders. Polypeptides with factor activity may be used to promote to augment or replace cells damage by and nucleotides that can be used to augment or replace cells damage by allness, end of cells and of cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damage by allness.
